Best App, Successful Customer Service and Agile Technology in Fintech

How to make a company scale from 1 to 35,000,000 customers and from 1 to 2,000 employees and remain as agile as Day 1?

I. Introduction to the case study

Few names have disrupted the financial services industry as rapidly as Nubank. In just a few years it has quickly become the leading financial technology (fintech) bank in Latin America and the world, and ramped up its customer base to 34 million and workforce to 3,700+ by the end of 2020. As of June 2021, the company is valued at USD 30 billion, and has also been recognized by TIME magazine as among the 100 most influential companies in the world.

The product portfolio Nubank offers to customers is similar to those offered by traditional banks and, in some cases, other fintech banks too: credit cards, personal loans, life insurance and investments.

Who are Nubank, how do they set their banking products apart from competitors and show such astronomical growth in customers, employees, and its valuation? Just as important, how does Nubank ensure their core values and operating principles are scalable as they continue growing exponentially?

In this case study we take a close look to examine how Nubank addressed the above questions.

II. Nubank: A brief introduction

Nubank is a fintech bank catering to the Latin American market. The company is headquartered in Sao Paulo, Brazil, where they first began operations. Today they also offer their services in Colombia, Mexico and Argentina. In addition, they have an engineering office in Berlin, Germany.

Unlike banks, the company does not offer a vast range of products and services, but instead has focused their offering on credit cards, personal loans, and digital accounts. Recently, they have also added life insurance and Pix – an instant payment feature, to their product portfolio.

Nubank's core principle since founding has been to offer customers a way around the cumbersome processes and hurdles they have to go through with traditional banks, with a focus on "solving financial problems using technology". As such, all products offered by the bank are based on a digital account, which is managed through a simple smartphone-based application.

Customers only need to undergo an initial evaluation upon enrolment, as opposed to the comprehensive credit checks conducted by traditional banks, and need to prove residency in Brazil, or their respective country. The minimalized enrolment checks are a key advantage over traditional banks.

In addition, there are no fees that Nubank levies for account administration or money transfers, and customers only pay the external network fee for withdrawals, which is what Nubank has to pay, without adding any charges themselves.

III. History: From inception and growth to current state

Nubank is the brainchild of David Vélez, who went through the experience of opening a bank account in Brazil, a process which took over 4 months to complete. David realized that the process was no less cumbersome outside Brazil – in other parts of Latin America, and that half the population of the region did not even have a bank account or credit card. From here, David had the idea to build and offer a modern solution.

David's background was also ideal to take on such a venture – he was previously a partner at Sequoia Capital, the world-renowned venture capital firm that previously invested in companies like Apple, Google, LinkedIn, and many others.

After months of research, David pitched the idea to his former colleagues at Sequoia Capital and secured initial funding. Just as important, David also made a second pitch to Sequoia to reinforce their trust in his idea. The

deck detailed the culture he would aim to foster at Nubank, which would have similar traits to the culture he saw at Sequoia – namely taking initiative, maintaining an entrepreneurial spirit, and acting as co-owners of the company.

We will dive into additional detail in later sections of this case study, but the emphasis on culture at Nubank remains a critical pillar of their success.

Taking on the financial sector in an economy like Brazil would be no small feat, so David teamed up with Edward Wible, a software engineer, and Cristina Junqueira, a former banker, as co-founders, and on May 6th, 2013, Nubank was founded *(Appendix 1: Nubank team)*.

The initial idea forming the basis of Nubank was formulated and is simple to put into words – offer customers a credit card at low interest, with no administrative fees, which they can manage via a smartphone-based application.

Launching with credit cards, as opposed to bank accounts, as part of their initial product strategy was also key to getting off the ground and up-and-running as soon as possible: Offering bank accounts would require a banking license, which Nubank did not have at the time. Credit cards, on the other hand, did not require any such license.

The credit card was launched in 2014, with the first transaction using a Nubank card made on April 1st of the same year. The product then took off, and for the next 4 years Nubank's success and immense growth came just from Brazil by fine-tuning this core product and building on it with supplementary products:

- Nubank Rewards, a loyalty program, was launched in 2017.
- By 2017, Nubank was able to acquire a banking license in Brazil too and was therefore able to start offering digital bank accounts (NuConta) to customers too, with no administrative fees.
- In 2018, debit payments were launched, and the company began testing personal loan offerings to select customers.

By 2019, Nubank had achieved profitability and stability in Brazil, and began looking into expansion with minimal risk to their core product offering in Brazil. Mexico had long been a key consideration for David since Nubank's initial founding, but the board of directors did not approve as their preference was for Nubank to stabilize and become profitable in their home market of Brazil first. Now that this had been achieved, the time for expansion was ripe. In May 2019, almost 6 years after initial founding, Nubank decided to begin operations in Mexico.

Most recently, in September 2020, the company announced it would expand to Colombia *(Appendix 2: Timeline of events)*.

Nubank's rapid growth has been supported by critical capital injections at various times throughout its history to date *(Appendix 3: Capital rounds)*. In addition, the company's growth has been both organic and has also come through acquisitions of other companies *(Appendix 4: Acquisitions)*.

Today, Nubank has an employee base of 3,700+ employees, and as of the end of 2020, it has over 34 million customers. In the following sections we will examine how Nubank managed to stay true to its founding principles and core values despite the massive growth rate.

IV. Success drivers: Customer focus, culture & technology

Nubank was born because of a terrible experience its CEO, David Vélez, went through when he was trying to open a bank account in Brazil. Before Nubank came into existences customers faced a number of issues with banks:

- Credit cards were not differentiated, there was no customization to customer needs.
- Customer service was really bad – clients would have to speak to multiple departments before their problem would be solved: fraud department, marketing, risk, amongst others.
- Banks and credit card companies used traditional channels to talk to customers (phone and websites) in a formal and technical tone, there were no mobile apps or social network presence like Twitter or WhatsApp. Most companies had legacy systems that relied on Credit Card Processors, and thought an API was something from the future.

David decided to get rid of these levels of bureaucracy and deliver solutions that actually made people's lives easier. Nubank's goal from the beginning was to deliver an amazing customer experience, as a financial services company that uses technology, design and data science to build products that solve customer problems. Over the years, Nubank created a set of customized products that would adjust to the need of each type of customers, specially the unbanked (young people), and offers great value for money to the customers (with great apps and omni-channels including WhatsApp and Twitter) resulting in a very profitable product offering at a low cost to Nubank.

The secret formula for success was that Nubank created a technology and a set of processes, that allowed it to manage all its cards (no processing fees from Card Systems Processors) and was able to attract low credit risk customers (it found good customers in all sectors of the society) and keep marketing costs low (most of Nubank's competition have high costs with miles and rewards). This was all made possible with great strategy and a lot of A/B testing.

Customer focus means all areas of the business are working together for the benefit of the customer. Customer focus at Nubank starts with product development and spans all the way to customer support. Nubank achieves customer focus through three pillars: culture, people (incl. organizational structure) and "enchantment".

When David Vélez designed the first pitch deck, he also designed the culture deck. From these initial talks about culture came the bank's core purpose – to fight complexity and empower people. This means that empowering customers has been, and always will be, at the heart of every decision Nubank makes. Nubank's culture pillars are:

- We want customers to love us fanatically.
- We are hungry and challenge the status quo.
- We think and act like owners.
- We build strong and diverse teams.
- We pursue smart efficiency.

Nubank's culture pillars are further reinforced by 3 principles:

- It empowers departments and its employees to take responsibility and solve issues in both small (even for an individual customer) and big manners (changing the system to avoid the error or issue for new customers).
- It was okay to make mistakes while trying (no action was a reason to be dismissed from the company).
- "It is always day one", David Velez's slogan which, among other things, means that it is always a day for testing and learning new things.

In a recent podcast[1] with Harry Stebbings, David described the gap he recognized between traditional bank services and customer needs. Brazil, as opposed to other more developed nations, had customers with real

[1] https://soundcloud.com/hstebbings/scaling-nubank-to-a-25bn

pain points, which Nubank set to solve with its customer centric approach. Customers in Brazil typically paid 450% APR on credit cards, numerous other administrative fees, and still had to wait for months for an account opening to be completed. In Mexico, the market is so concentrated that five banks owned 90% of all assets in the financial system, so there was very limited competition. He maintains that "the pain is 10 times what you might experience in the US, and so if you can manage to approach that pain with a product that is 100 times better, that ultimately translates into extremely low or close-to-zero customer acquisition cost" (CAC).

Nubank's focus has therefore always been on building the absolutely best product they can, so customers may have the best experience. Instead of investing money and marketing and giving that money to Google and Facebook, they prefer to leave that money in the pockets of their customers by not charging any fees. This creates word of mouth, which enabled Nubank's exponential growth with a close to zero CAC.

Beyond customer service: WoW moments

"WoW" started in 2015, with allowing every Xpeer (customer service representative) to send a gift and handwritten note to a customer every month. It then evolved to sending messages and gifts or "treats" whenever there was an outstanding conversation or a connection between a Nubank service team member and the customer. WoWs became a way of marking outstanding moments that mattered. These could even be sent in real time, as in the example where a customer was sent a car when they had no credit card to complete registration on a transport app. Several Nubank WoWs have even gone viral on the internet, like a purple sandwich maker for a customer who had problems buying a sandwich at dawn, or a Pikachu with a purple cover for a Pokémon fan client. Yuri Dantas – Head of Customer Excellence at Nubank explains that "WoWs are not a marketing action detached from our values – quite the contrary. WoW is a reflection of what we experience every day, in all areas of the company: the focus on the customer"[2].

[2] https://blog.nubank.com.br/wow-o-que-sao-os-presentes-enviados-pelo-nubank/

V. Scalable agility: Growth vs. quality as you scale

In the same interview, David describes how he managed the apparent trade-off between growth and quality. As a start-up you want to grow, however if that comes at the expense of quality, then you're losing what is giving you that growth. The other extreme is you need to maintain perfect quality, there is no tolerance for failure, there's a fear of crashes, which for start-ups can mean instant death. So, what's really hard is finding that balance where you are able to sustain both large growth and great quality. David realized eventually that quality gives you growth and growth actually gives you quality, they shouldn't necessarily be viewed as a trade-off or a zero-sum game.

David proved that if you design the company the right way, the technology and culture can give you both growth and quality in the long term, i.e. better service quality will give you growth in the long term and higher growth will allow you to invest more in better systems and better people, thereby enhancing quality of service. That way, they actually end up reinforcing each other.

Scale from product #1 to 2,3,4,5

Nubank's focus on the customer and initially solely on credit cards was instrumental in its growth. What was the formula? Nubank cracked the code with its first product. They did only credit cards for 4 years and focused on nothing else. They built a phenomenal brand that people love with that first product experience which worked very well, especially when compared to the competition. They built trust, very high and stable Net Promoter Score (NPS). Nubank proved that if you're really solving a problem with Product 1, people will be very willing to get your Product 2, Product 3, and Product 4.

Nubank had to evolve from building a credit card company to becoming a multi-product bank so they had to re-focus their infrastructure and organisational structure to go multi-product, multi-geographic, which was a significant effort. However, as they launched each successive product while continuing to grow NPS, launching the next product became easier.

Scaling a design team, culture and A/B testing

Nubank values design and great experiences, so building a design culture was not complicated, however scaling it is challenging. One key to success was the fact that the team defined a clear vision and core principles that helped define how people will experience their products. These are Nubank's design principles[3], which are very aligned with agile development methods *(Appendix 5: Agile)*:

- **Start early:** This allows for rapid experimentation and innovation.
- **Co-create:** Understand your customers' and co-workers' point of view about the problem and iterate frequently.
- **Go beyond:** Look beyond the problem at hand as the immediate answer might not be ideal, iterate frequently to learn, validate and improve.
- **Context:** think hard about and connect to the context in which people are using our services. People adapt to and are affected by technologies and their environments.
- **Humanize:** Deeply understand user pains, demographics and culture, their needs and emotions, so you can create experiences that encourage trust and responsibility.

Systems and product design

Nubank user base grows and shifts constantly, meaning that research done three or four months ago may be obsolete within a short period of time. Nubank had to make research a more distributed and frequent practice. The research team is therefore in constant conversation with customers, even when they don't have a new product to be launched. The research department found that polished reports had little audience, so they invited customers to the office and had interested people in another room watching and interacting[4].

The team had many such A/B tests running in parallel for a long time. To make this possible, agile development principles were applied in conjunction with an automated system infrastructure. Agile, to Nubank, meant doing less to deliver more, as Nubank is continually improving its methods and work practices. They did two simple things, which was to manage the work in progress and decrease the size of demands, which helped improve lead time and throughput[5]. These practices help get feedback faster, make it easier to manage risks, and shorten solution delivery time.

As a newcomer, Nubank was able to design a system from scratch and was not constrained by legacy mainframe systems. From the start they adopted a functional programming philosophy using Clojure. Nubank is obviously cloud native (AWS), they are heavy users of Kafka and use Datomic for most transactional workloads, which is like Git for data. They built the credit card processing system from scratch. Machine learning was put in production in KYC, credit scoring and credit management. They also created a general ledger system as a system of record[6]. Nubank open-sourced Sklearn wrapper library for three Python libraries they use extensively: Xgboost, LGBM, and ScikitLearn.

Nubank runs a microservices architecture and most of their services are written in Clojure, using Datomic for storage, and connected with Kafka queues and REST APIs with other services and their clients[7]. The core system at Nubank relies on internal APIs that provide information and decisions to the core system. Each API is controlled and developed by an internal IT member, in a modular system, who reports directly to the Area Director. Each API was created using Model View Controller (MVC) design, so every API maintains control of a small piece of the database (the model), its own front-end (the view), usually for internal use and testing only, and the actual code (the controller). Every API was done not only to support customized actions for each customer but to support A/B testing as its main feature. This system infrastructure is agile, as small sprints can be implemented in days, not in months, through constant learning and many interactions. This cloud-native suite of back-office services helps keep Nubank flexible, scalable and highly secure.

International expansion

International expansion followed a similar process as product development. Nubank started in a very large country, Brazil, and did not face the pressure that most start-ups in smaller countries face, to expand internationally as soon as possible. It is still a difficult decision, even for a successful start-up, like Nubank, to choose between continuing to develop in its large domestic market, or starting in a second country. Taking a longer-term view, Nubank knew they would eventually have to expand internationally, which would expand

the total addressable market and provide an opportunity to leverage the technology, culture and people they developed in Brazil.

David presented a plan to the board to expand to Mexico in 2018, however the board rejected it and pushed David to focus on Brazil. He brought up the topic again in 2019, and by this time Nubank was hugely profitable in Brazil, cash flow positive, with a great product market fit, received a banking licence, and was funded solely by deposits. Nubank had de-risked the business massively, which meant they would be able to take this next step by risking only a small percentage of the core, which continues to be the most important part of Nubank's strategy.

Capital as a limiting factor, increasing demand

Capital management is key for any start-up, but especially for a bank. When Nubank started, they received an avalanche of applications, but they knew they did not have the capital to give all prospective customers a card, so they created a waiting list. A Nubank card became almost an exclusive and desirable asset to have. The fact that it was exclusive, plus a lot of smart social media and influencer marketing created even more demand for the product, which created more scarcity. This constrained demand allowed Nubank to raise capital from investors, firstly to solve the obvious capital need, and also to enable accepting more customers and continuing their accelerated growth.

Nubank has the DNA of a technology company, however they also need a lot of expertise in the traditional banking areas like liquidity and capital management. With several banking licences, Nubank as a regulated entity needed a strong team in traditional areas such as risk management, compliance, amongst other traditional areas, so we discuss how Nubank built its banking teams next.

Hiring the right people

In the podcast mentioned earlier, David discusses a very interesting topic of the inherent conflict in being both founder and CEO, and recognized that he needed to evolve as a leader as the bank scaled. He says he found it odd that the founder and CEO titles are typically so linked to each other. Some of the things that a great founder does, however, need to be tuned down a little bit to be a great CEO.

David, the founder, argues that you have to have very strong convictions as you're essentially taking a bet. As a founder, you are going all in and are therefore completely concentrated, and risking everything you got on one bet. That takes a significant amount of conviction as you have to be willing to ignore a lot of voices and go against people who may be close to you. Founders prefer to get their hands dirty and build a product with their own hands.

On the other hand, David, the CEO, argues he can't do that. CEOs need to evolve in order to listen to a number of different voices. They have to be great managers, and as a CEO of a large company you need to oversee scalability and engage people who build the products. As a CEO you can give your opinion, but you are not building the product yourself. You're not building your own house – you have large teams of people that are building the product. Large teams of people are talking to customers, and while initially, Christina and David could take customer calls on their phones, as the business grew, they couldn't afford to do that any longer.

In addition, as founders really struggle with delegation, hiring the right people becomes essential. A CEO takes on many roles, he or she is leading an organisation, he or she is recruiting great talent, and building a great team. David realized he did not need to have all the answers, but all he needed was to be willing to bring great talent that has all those answers, and let them do their best work. That is what truly defines a scalable solution, but it takes a conscious effort that not every founder is able to do.

VI. Conclusion

In summarizing our research, we look to recap some of the key points contributing to the essence of Nubank's success and what has enabled them to maintain the same focus and principles now, as they did on Day 1.

Nubank has achieved such immense success in a short period of time by essentially staying true to the goals and philosophy outlined at the inception of the company when David Velez first pitched to his former colleagues at Sequoia Capital:

1. **Solve a problem:** Nubank was founded around observations that traditional banks in Brazil were not geared to customer needs or making banking products easy to obtain, thereby shooting themselves in the foot. Nubank was founded to solve exactly that problem – identify the banking product most in need (credit cards, bank accounts), and make the process of getting them as simple as possible.
2. **The company culture is in everyone's DNA:** Inspiring a culture that encourages employees to act entrepreneurially is critical, so they have an incentive to find the best solutions possible. In addition, fostering the mindset that it is OK to make mistakes and to take every day as if it is Day 1 is key to enabling Nubank in taking on the banking powerhouses in the markets they operate in.
3. **Recognize that growth does not need to come at the expense of quality:** As the perfect example of this, Nubank's board did not approve expanding internationally until they had full stabilized and established solid ground in Brazil, their domestic market. Once this was achieved, they could focus on expanding internationally without risking their existing success. Many companies or start-ups look to grow as soon as possible, without regularly doing a self-check on key areas to address. This leads to scaling not only the company, but also the problems that persist. This way, any failure in their growth strategies has the potential to harm the core of the company itself, a risk that Nubank mitigated before looking to grow.
4. **Everyone in the company, up to the CEO and co-founders, puts the customer first:** David and Cristina took customer calls themselves in the early years. X-peers (Nubank's customer service department) are empowered to make customer-impacting decisions and act entrepreneurially, since they are typically the interface between Nubank and the customers. WoW moments enable employees in applying a more personal touch when saying thank you to customers for choosing Nubank.
5. **Employ a Design Thinking mindset:** Nubank's research team is always interested in understanding customers' acceptance of new features and capabilities, and this way they ensure the focus remains on solving customer problems, the baseline of all of Nubank's success. Employing an Agile methodology as well as A/B testing, fit perfectly within this focus.

I. Appendix 1: Nubank team

Co-founders and selected management team members	
	David Vélez, *CEO & Co-founder* David Vélez is the Founder and CEO of Nubank since 2013. David was a Partner at Sequoia Capital in charge of the firm's Latin American investments. Before Sequoia, David worked in investment banking and growth equity at Goldman Sachs, Morgan Stanley and General Atlantic.
	Cristina Junqueira, *VP Branding, Business Development & Co-Founder* Cristina is the co-founder and also VP of Branding and Business Development at Nubank. She started her career in Strategic Consulting at BCG (Boston Consulting Group). Prior to Nubank, she worked for many years at Itaú Unibanco, dealing with Product and Marketing for the bank's consumer loan and credit card businesses.
	Edward Bible, *CTO & Co-founder*
	Gabriel Silva, *CFO*
	Bruno Giacomelli, *Manager of Customer Experience Operations*

II. Appendix 2: Timeline of events

2013:

- March: After years of bank frustration, David Velez raises USD 2 million seed funds from Sequoia Capital and Kaszek Ventures for a new financial services start-up in Brazil.
- May: David recruits Edward Wible and Cristina Junqueira and founded Nubank in a house on California Street in Sao Paulo.

2014:

- April: The first transaction with a Nubank credit card.
- September: Nubank credit card is released to the public.

2015:

- January: Moving from the house on California Street to a three-story office on Brigadeiro Luís Antônio Avenue in São Paulo.
- March: Voted Most Innovative Company by Latam Founders.
- December: Voted the most innovative app by the App Store.

2016:

- January: Moving to the current eight-story building on Capote Valente Street in Sao Paulo.
- May: Marketers That Matter Award winner from Sage Group, Silicon Valley. Voted Best B2C Company by Latam Founders.
- July: Chosen by Interbrand for Breakthrough Brands List.
- August: Voted one of the Best Companies to Work For by Great Places to Work Brazil.

2017:

- January: Voted Best Card by the clients on CVA Solutions research.
- March: Named for the second year in a row the best B2C company by Latam Founders.
- August: Nubank Rewards release.
- October: Nubank digital account release.
- December: Office opening in Berlin, Germany.

2018:

- March: Nubank became a unicorn, surpassing USD 1 billion valuation.
- May: Release of the new app design. Nubank's first advertising campaign, "The New Always Comes".
- June: Countrywide release of Nubank digital account in Brazil.
- September: Voted the Most Desired Company to Work For by LinkedIn Top Startups Award.
- October: Investment of USD 90 million from Tencent. Opening of Nubank's second office, a 16-story building also on Capote Valente Street in São Paulo.
- December: Debit function release for Nubank digital account's users.

2019:

- February: Launch of Nubank Personal Loan. Elected Latin America's Most Innovative Company by Fast Company Magazine.

- March: Voted best bank in Brazil, according to Forbes magazine. Reaches 100% of Brazilian municipalities.
- May: Announced its arrival in Mexico. Elected Brazilians Preferred Credit Card in CardMonitor Survey.
- June: Announced its arrival in Argentina.
- July: Start Business Account testing.

2020:

- January: Nubank's first acquisition – software consultancy Plataformatec.
- March: Announced its arrival in Mexico.

VI. Appendix 6: Financial data

As of June 2020:

- BRL 17.3 billion in deposits.
- BRL 19.9 billion in cash, 40% increase compared to December 2019.
- BRL 2.079 billion in financial intermediation revenues, 104% increase compared to December 2019.
- Customers: from 11 million at 2019 fiscal year-end, to 26 million at 2020 fiscal year-end, an average of 41,000 new customers per day.
- Below average default rate 5.8% vs. 7.5% for the industry.
- BRL 95 million loss, 32% better than same period in 2019.
- Tier 1 capital ratio: Nubank 26.07%, regulatory requirement 6%, 16.9% system average.
- Goals:
    - Continue to cautiously deploy the balance sheet.
    - Maintain tier 1 capital above 20%.
    - Credit cards to be 60-70% of the loan portfolio, personal loans 10-30% and SME loans 5-10% by fiscal year-end 2021.
